

This table addresses vital aspects of project initiation and integration management such as the project charter, the importance of project stakeholders, and the project planning and management process.

<b>Priority/ Risk</b>  <b>Project Area</b>	<b>4</b>  <b>Minor investment, informal schedule goals, low organizational priority and visibility.</b>	<b>3</b>  <b>Moderate investment, definite schedule target, some organizational priority and visibility.</b>	<b>2</b>  <b>Significant investment, important schedule goals, medium organizational priority and visibility.</b>	<b>1</b>  <b>Major investment, critical schedule goals, substantial organizational priority and visibility, significant technical and cost risks.</b>
<b>Project Charter</b>	Prepare a one page memo of understanding between the sponsoring manager and the project manager (PM) listing the project objectives, priorities, resources, commitments, and constraints.	Identify quantifiable objectives, cost and schedule targets; outline staffing commitments, funding, and assets; list significant areas of authority matched to responsibilities.	Define specific performance goals and cost and schedule thresholds; describe PM authority and organizational commitments; write and sign charter as an informal contract.	Document project manager's responsibilities, authority, relationships, objectives and priorities; establish performance incentives; make commitments for funds, staff, facilities, assets.
<b>Project Stakeholders</b>	Identify project stakeholders (customers, sponsors, users, etc.) and bulletize their interests and objectives on one page; review project plan to ensure stakeholder satisfaction will be achieved.	Map stakeholder interests to specific initiatives to ensure satisfaction; develop, maintain, and post team success metrics; plan proactive stakeholder communications.	Prepare stakeholder management plan, and allocate staff and budget to periodic reassessments and corrective actions; focus specific initiatives to achieve stakeholder satisfaction.	Prepare and update a structured stakeholder analysis supporting a stakeholder management plan; map to the quality plan, risk management plan, and to project reporting initiatives.
<b>The Project Plan</b>	Summarize project objectives, approach, time constraints, cost estimates, and staffing plan; ensure they fit together and are realistic and achievable; define milestones and link tasks to owners and deliverables.	Employ planning process to build team ownership and facilitate peer review; apply systematic methods to assess cost and schedule realism; plan more heavily in risk areas; apply all PM principles in plan.	Prepare a plan that links the requirements, task plans, timelines, cost estimates, staffing, deliverables, and test plan; make sure cost, scope, and time are bounded; define success criteria for milestones.	Produce an integrated family of documents defining all project activities and disciplines; plan for mapping and traceability throughout major documents; systematically address all PMBOK areas.
<b>Project Management Methodology</b>	Apply basic project management techniques - document the requirements, prepare a realistic plan, apply baseline controls, conduct periodic reviews, assess risks and manage them.	Include outline of proposed project management methodology in project plan document; identify vital PM systems and procedures.	Document PM approach, including baseline management, reviews, data collection, project metrics, and control responsibilities; monitor and report status of PM implementation.	Prepare a formal project management plan describing the methodology, planning standards, project reviews, baseline controls, roles and responsibilities, and metrics to track implementation success.

This table addresses requirements definition, scope control, as well as baseline management and the time-honored work breakdown structure.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b> Minor investment, requirements well understood and reasonably stable, familiar internal customer.	<b>3</b> Moderate investment, requirement not obvious, potential for misunderstandings, familiar customer.	<b>2</b> Significant investment, significant requirements, probable changes, significant technical unknowns.	<b>1</b> Major investment, extensive requirements, volatile environment, substantial visibility and technical risks.
<b>Requirements Definition</b>	Understand the requirements and document them clearly; obtain agreement of key stakeholders; put the requirements document under informal version identification and change control.	Document business case and detailed performance based requirements specifications; use modular structure for documenting functions, performance and features.	Review detailed requirements definition with customer and sponsor; employ walk-thrus, simulations, prototypes, demonstrations, mock-ups or draft user documentation.	Conduct a rigorous, extensive, detailed requirements definition and review process; map requirements to design and test documents; obtain independent peer reviews and get formal customer approvals.
<b>Work Breakdown Structure</b>	Prepare WBS to level 3 to ensure comprehensive identification of tasks and outputs; firm-up WBS early and communicate to the team.	Use WBS to prepare responsibility matrix, cost estimates, and schedules; publish WBS as a project baseline document; use WBS to assign timesheet charge numbers.	Prepare a WBS dictionary to level 3 to communicate task content and reduce ambiguity; use WBS structure to aggregate cost data and organize production of deliverables.	Use a <i>product-oriented</i> WBS to organize requirements, planning, scope, schedules, budgets, support disciplines, testing, and deliverables; map WBS to an organizational breakdown structure.
<b>Product Baseline Controls</b>	Use the requirements document to establish baseline stability; have the PM approve all changes; assign version identification and change controls as the product design matures.	Place requirements document under formal control; require change request approval by PM; report metrics to track scope changes; map design and testing to the requirements document.	Establish configuration identification, status accounting, a change control process (using change proposals and a control board (CCB) chaired by PM), and configuration audits; staff a formal CM function.	Establish baselines for system requirements, functional, and allocated specs, and product design; evaluate ECP impacts and get functional approvals prior to CCB; manage the pace of change.
<b>Project Baseline Controls</b>	Clearly identify the cost and schedule goals and establish baselines; maintain a diary of cost and schedule revisions; track actuals and latest revised estimates against original baselines.	Document cost and schedule baselines; report metrics to show changes against milestone estimates; document all scope changes and track schedule progress against baseline goals.	Establish formal cost and schedule baselines and apply disciplined controls; report all baseline changes or replans; define tasks in discrete work packages; formalize reporting process and formats.	Establish firm cost and schedule baselines between major milestones and report variances; require sponsor signature on baseline replans; use a work package approval and authorization process.

This table addresses the important issues of managing schedules, schedule estimating, critical path management, and schedule tracking.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b>  <b>Informal schedule goal, simple dependencies, low management interest, familiar project tasks.</b>	<b>3</b>  <b>Definite schedule goal, numerous dependencies, some project visibility, some unknowns.</b>	<b>2</b>  <b>Important schedule goal, significant dependencies, high project visibility, moderate unknowns.</b>	<b>1</b>  <b>Critical schedule goal, complex dependencies, high interest project, significant unknowns.</b>
<b>Project Schedules</b>	Establish target date and major milestones; prepare Gantt schedule and route to team; get team buy-in of realism and goals; use subsidiary checklists to keep schedules from becoming cumbersome.	Prepare top-level Gantt schedule and sub-team rollups; identify major and intermediate milestones; scrutinize dependencies; maintain baseline stability between major milestones or formal replans.	Publish schedules and keep status updates visible; maintain schedule baseline discipline and traceability; document milestone exit criteria; report and track schedule variances and performance indexes.	Use comprehensive automated scheduling system; document procedures for schedule baseline management and data collection; swarm on problem areas with micro-schedules and daily status meetings.
<b>Schedule Estimating</b>	Estimate schedule durations based on work content and staff availability, duration analogies to previous work, and management judgments; identify dependencies, and assess schedule risk areas.	Document schedule estimates based on historical data and estimates of work and staffing; keep work packages smaller than two weeks; assess schedule risks and apply contingencies.	Document schedule assumptions and estimating methodologies; evaluate and elevate schedule uncertainties; obtain independent expert assessment of schedule realism.	Use a documented schedule estimating methodology; apply historical data, analogies, and expert judgments; obtain team ownership of schedules; quantify risks and apply contingencies.
<b>Critical Path Analysis</b>	Identify the critical path/s informally on a Gantt schedule; keep the team members mindful of the critical path; look for ways to shorten the critical path; pay attention.	Identify schedule dependencies and design hand-offs clearly; use a PM tool to compute critical path and print it out; report path status periodically; discuss alternatives and risks to shorten the critical path.	Conduct risk assessment along the critical path; manage the critical path to tighten and identify workarounds; rethink dependencies to accelerate overall schedule.	Conduct statistical assessment of schedule risks (PERT); examine opportunities for streamlining, crashing, and concurrency; watch for emerging near-critical paths and assess risks.
<b>Schedule Tracking</b>	Update status of project schedules to show actual progress and revisions compared to baseline plan; keep original schedule goals visible until formally replanned; keep status visible.	Collect data for percent completions and planning revisions periodically; report status against traceable schedule baseline; document methods for assessing earned value; highlight problem areas.	Track schedule progress against formal baselines for all tasks; identify level of effort tasks; use repeatable procedures for data gathering, earned value assessment, and status reporting.	Document procedures for schedule baseline management, criteria for determining completions, data collection, analysis and reporting (see C/SCS in Cost section).

This table addresses cost estimating, budgeting, and practical application of Cost/Schedule Control System (*earned value*) techniques to smaller projects.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b>  <b>Minor investment, level of effort tasks, within current budgets, cost risk considered low.</b>	<b>3</b>  <b>Moderate investment, varied cost accounts, project budgeted separately, some cost risk.</b>	<b>2</b>  <b>Significant investment, costs from different sources, capital budget item, significant technical and cost unknowns.</b>	<b>1</b>  <b>Major investment, diverse expenditures, substantial visibility, substantial technical and cost risks.</b>
<b>Cost Estimating</b>	Apply management judgment to estimate and justify costs; use staffing estimates, labor costs, available quotes or procurement estimates to establish a cost target and assess project affordability	Prepare a written cost estimate; document data sources and estimating assumptions; validate estimate by analogy and historical data; scrutinize cost drivers.	Prepare formal cost estimate with documented assumptions, using a documented methodology and historical cost data; require approval by an experienced cost estimator.	Prepare cost estimates at the work package level; use modeling, sensitivity analysis and identification of cost risks; obtain independent cost assessment; produce an auditable backup package.
<b>Budgeting</b>	Establish ball-park estimates of time-phased budget goals; track staff usage and procurements against plan to monitor project spending; report budget status periodically.	Allocate budgets by groups within the project, establish project spend plan and track and report actuals; prepare periodic updates of estimate at completion.	Allocate budgets by group or WBS element; prepare spend plans at cost account manager level; track group budgets; reconcile project budgets to funding, capital budgets, and funding risks.	Rollup or allocate project budgets by WBS element; cost account managers commit to costs; collect data at the work package level; establish time phased budget baselines at the cost account level.
<b>Cost &amp; Schedule Control System</b>	Prepare periodic guesstimates of work percent accomplished and resources spent, and compared to that planned; compute cost and schedule variances and performance indexes at WBS level 1.	Maintain traceable planning baselines to facilitate cost and schedule tracking; collect earned value estimates and actual spending data to calculate variances and indexes at WBS level 2.	Establish time-phased budgets at WBS level 3; maintain traceable baselines and collect data to report variances and indexes at level 3; refine accounting system to provide reliable, timely data.	Document systems and procedures for cost and schedule data gathering and reporting; report variances at WBS level 4; audit the system using the earned value Joint Implementation Guide criteria.
<b>Cost Analysis</b>	Prepare cost estimates informally; justify project approval based on rough assessment of cost reasonableness, affordability, and benefits; use judgment for trade-off analyses.	Prepare written cost estimates using available data, judgment and analogy; apply ball-park estimates to project changes and decision points; conduct trade-off studies on cost drivers.	Apply documented and systematic approaches to cost impacts of project decisions; review estimates and conduct sensitivity analysis on major assumptions; use dedicated cost engineering professionals.	Prepare documented cost estimates for changes; maintain auditable files of backup assumptions, data, and methodologies; use a standard WBS to build historical costs database for future estimates.

This table addresses the planning and management activities that make the project output conform to the requirements and help to ensure a satisfied customer.

<b>Priority/ Risk</b>  <b>Project Area</b>	<b>4</b>  <b>Quality goals easily understood, achieved, and monitored.</b>	<b>3</b>  <b>Quality goals can be defined and measured using existing systems and methods, quality risk low.</b>	<b>2</b>  <b>Quality goals are extensive, require innovative approaches, and may impact project success.</b>	<b>1</b>  <b>Quality goals are difficult to define, hard to measure and achieve, significant risk to project acceptance.</b>
<b>Quality Assurance Plan</b>	Define quality goals; discuss approach and plans to achieve goals; assess risks to achieving quality success; discuss the adequacy of the quality management approach; set high standards.	Document explicit quality goals; define methods and tests to define, predict, control, achieve, and verify success; focus on customer satisfaction; prepare plan for using quality metrics.	Document QA goals, plans, methods, and systems; consider the <i>Ilities</i> in quality goals; focus processes on minimizing correction costs; use peer review to build comprehensiveness in plan.	Prepare a formal QA plan including quantitative goals, management methods and organization to achieve goals, quality metrics, controls and verifications; link QA to stakeholder and risk analysis.
<b>Quality Management</b>	Establish quality management integral to the project work; ensure project team understands their role in achieving quality goals; maintain visibility of quality issues and track status.	Implement integrated quality management through delegated quality goals; plan work methods, technologies, measurements and controls to achieve goals; build quality into processes and products.	Integrate quality management tasks into project plan; establish objective quality goals; delegate goals to work groups; report quality metrics and track progress; identify and highlight quality trade-offs.	Assign quality management oversight in the project staff; monitor metrics and trends to achieve quality goals; integrate quality management into project planning, staffing, and risk management.
<b>Quality Metrics, Measurements, &amp; Controls</b>	Conduct quality assessments periodically (these may be objective and quantitative or qualitative and subjective); monitor and report quality status at periodic project reviews.	Map quality metrics to quality goals and report periodically; apply standard quality tools to measure, predict and control results; make quality metrics visible at management reviews.	Establish quality metrics and conduct quality audits to predict and verify achievement of goals and identify needs for corrective action; apply quality control techniques to project effort.	Implement a best practices quality control organization; document quality methods integral to project planning; provide commitment of staff, tools, and methods to support quality effort.
<b>Continuous Quality Improvement</b>	Communicate continually a project goal to work smarter and find better processes; plan the project to accommodate future improvements; document processes to provide benchmarks for improvement.	Review the project approach and product architecture to provide for modularity, expandability, and growth; build CQI provisions into the product life cycle strategy.	Include CQI tasks in project plans and budgets; establish CQI goals and metrics, and report progress periodically.	Incorporate CQI goals into specifications and plans; periodically review project methods; institutionalize CQI processes and incorporate CQI provisions at the configuration item level.

This table addresses the importance of leadership, staffing, organization, and team building.

<b>Priority/ Risk</b>  <b>Project Area</b>	<b>4</b>  <b>Small project team, previous working relationships, cohesive team culture, experienced in project area.</b>	<b>3</b>  <b>Medium sized team, divergent organizational groups, available skills and staff resources, familiar with project culture.</b>	<b>2</b>  <b>Large, diverse project team; potential scarcity of skills and staffing, unfamiliar and divergent cultures.</b>	<b>1</b>  <b>Very large project team, wide experience requirements, scarce skills, differing organizational goals and project cultures.</b>
<b>Project Leadership</b>	Communicate project goals; manage the project team as a group; foster ownership of plans and tasks; build relationships through communication and consideration; set high standards and lead by example.	Establish clear goals and roles; institutionalize practices of communications and good will; identify and resolve issues and conflicts; delegate to workgroups; build ownership and establish success metrics.	Ensure management commitment and disciplined approach; emphasize communications, baselines, metrics, and issue resolution; address need for outside and inside project manager roles.	Select a disciplined project manager with excellent communications, leadership, coaching, technical and project experience; provide for active sponsorship and senior management oversight.
<b>Staffing Plan</b>	Identify resource requirements, assign staff, plan for training and backups; decide the <i>what</i> before the <i>who</i> ; monitor adequacy of staffing and report status to project sponsor; take assertive action to fix shortfalls.	Consider project tasks and organization first, then plan staff to fill requirements; build staff plan from Gantt resource estimates; delegate ownership of staffing plan; involve team in planning process.	Perform structured analysis of skill types and quantities; use resource scheduling estimates; plot graph of requirements versus actuals and report status periodically; track recruiting, training, and retention.	Determine needed skill levels from work package estimates; review skill requirements and prepare analysis; plan hiring and training to meet gaps; report staffing metrics as critical project success factor.
<b>Project Organization</b>	Identify project roles and responsibilities; plan for clear ownership of tasks and delegation of responsibilities; develop plans to cope with impediments; encourage informal communications.	Publish and maintain organization chart; address realities of conflicting goals and loyalties; promote team ownership of integrated solutions; analyze job content to optimize skills mix.	Consider matrix organization with strong PM functions and administrative support; document plans to surmount structural short-comings; use cross-functional teams to help concurrencies.	Document project roles and responsibilities; map organizational breakdown structure (OBS) to WBS and communications plan; use <i>strong-matrix</i> or <i>projectized</i> organization structure.
<b>Project Team Building</b>	Take responsibility for leading the team; develop strategies and plans to build group cohesion; work with team to identify needed skills and behaviors to enhance team performance.	Conduct team sessions to improve communications and facilitate issue identification and resolution; build team identity; solicit and address team concerns.	Identify criteria for successful team performance; articulate strategy and plan for achieving team goals; develop metrics and monitor status; invest to improve team dynamics and cohesiveness.	Articulate a team building vision, objectives, and strategy; provide goals, supportive resources and tools, and meaningful measures of success; develop team ownership of this process.

This table addresses the concrete management actions to promote this human activity that is so vital to project success, but too often performed marginally.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b> <b>Small project team, no significant organizational boundaries or cultural differences, previous working relationships.</b>	<b>3</b> <b>Medium size project team, some organizational diversity, unfamiliar working contacts, geographical separations.</b>	<b>2</b> <b>Large project team, diverse organizations and cultures, differing contractual relationships.</b>	<b>1</b> <b>Very large project team, numerous organizations and interfaces, diverse cultures, numerous geographic locations.</b>
<b>Communications Planning</b>	Identify communications objectives, plans, and constraints; plan internal and external communications; identify key players, messages, and media; plan to make PM accessible and communicative.	Identify communications requirements, technologies, constraints and assumptions; draw communications flow diagram; plan inclusive team structure to shorten communications paths.	Use stakeholder analysis to identify communications paths; plan for multiple communications media; plan to shorten vital information paths by new relationships, attitudes, or techniques.	Document plans for project team inter-communications, project documentation flows, project advocacy, organizational change management, and public and community relations.
<b>Information Distribution</b>	Identify key players and keep them informed; encourage and exercise information exchange within project team; identify information hand-off dependencies in advance; use multiple media.	Communicate availability of work results; prepare methods for communications storage and distribution; conduct regular meetings to identify critical issues; counteract communications boundaries.	Establish communications lists and interest areas; identify multiple media paths; solicit feedback on info. adequacy; exploit technology to improve communications; use Intranet for project information.	Identify the information requirements of all parties; ensure communication channels in place; track required message delivery; establish distribution lists by subject area.
<b>Progress Reviews and Reporting</b>	Conduct periodic reviews of progress, risks, and issues with sponsor and stakeholders; conduct requirements reviews and process walk-thrus early; communicate status and design throughout project.	Conduct management and design reviews with key stakeholders; review plans, progress and changes; focus on early identification of requirements and management of risks; track status trends.	Establish schedule for regular management and design reviews; emphasize early review and approval of requirements, cost and schedule estimates, technical approach, and staffing plans; freeze reporting formats.	Plan periodic cost, schedule, and issue reviews (frequently at first); plan for periodic reviews of design progress and at design milestones; conduct reviews and working meetings in all special interest areas.
<b>Project Documentation and Records</b>	Package project working papers in notebooks; have tasks result in smooth documents; plan early for customer support documentation; record project lessons learned.	Use documentation to establish baselines and communicate to project team; plan tasks with deliverables in mind; identify design data needed for support documentation; define document set needed at finish.	Define requirements for project library, deliverables, support documentation, and historical record; budget and staff a data management function; exploit electronic media and distribution.	Establish a comprehensive definition of documentation requirements; distribute standard report templates; track data production, deliveries and approvals; formalize project data library.

This table addresses the use of structured methods for identifying, evaluating, and responding to risks throughout the project environment.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b>  <b>Not a significant investment, familiar project tasks, low risk technologies, low impact of project failure.</b>	<b>3</b>  <b>Moderate investment, some unfamiliar tasks and technologies, medium risk impacts.</b>	<b>2</b>  <b>Significant investment, unfamiliar project tasks, new or innovative technologies.</b>	<b>1</b>  <b>Complex project with potentially volatile risk issues and exposures, uncertainties inherent in plan and technologies.</b>
<b>Risk Element Analysis</b>	Use management judgment to list expected risk areas; highlight risk areas that threaten important project objectives; identify the manageable risks.	Document risk areas and evaluate low-medium-high risks; identify risks with significant impact; scrutinize requirements and conduct a project domain analysis to uncover hidden risks.	Establish structured methodology for identifying, quantifying, and assessing all potential project risks; use WBS and stakeholder analysis to ensure comprehensive risk list.	Document risk identification, probability, and consequences for objectives, specifications, and stakeholder interests; employ Delphi, multi-attribute utility, PERT analysis, and best practices risk templates.
<b>Risk Avoidance and Mitigation</b>	Identify the risk areas, technologies, or methods that present unattractive risks; incorporate into the project plan specific actions to minimize each area of risk exposure.	Assign study teams to develop risk avoidance/mitigation plans for excessive risk items; plan for early testing and tighten contract structures to reduce risks.	Develop risk deflection strategies for all significant project risks; incorporate adaptive actions into project plans; develop contingency plans to cope with unforeseen events.	Conduct cost/benefit analysis and review stakeholder priorities to select candidates and strategies for risk deflection; evaluate performance trade-offs to achieve acceptable risks.
<b>Risk Management Plan</b>	Plan and structure your work processes specifically to address risk areas and exploit opportunities; modularize your project and product to compartmentalize risks and minimize risk compounding.	Address each significant risk item and apply a specific PM or technical approach to minimize, manage, and control risk events.	Develop actions steps and staffing to reduce uncertainties and control risk areas; develop a critical items list and manage with high visibility.	Document plans for risk focused management attention to respond to all risk areas; apply risk templates (or lessons learned) to project life cycle; take specific initiatives to mitigate risks early.
<b>Risk Metrics</b>	Flag key risk issues to monitor; develop informal indicators of risk status; report risk assessments and risk management effectiveness at periodic reviews; highlight high risk areas and adverse trends.	Assign all risk areas low-medium-high assessment and update and report status and trends; use qualitative or subjective metrics if none better available; make a top-ten list.	Develop measurable indicators of risk exposure; report status and trends; monitor risk management effectiveness and report progress at reviews; address risks for each PMBOK area.	Develop metrics for all risk areas, and report status and trends; track impact of risk control actions on lessening risks; focus on high priorities; and highlight areas not responding to corrective action.

This table addresses acquisition management and contract administration as methods for reducing risks to project cost, schedule, and quality.

<b>Project Area</b> / <b>Priority/ Risk</b>	<b>4</b> Small procurement actions, no significant administrative hurdles, simple requisitions, low procurement risks.	<b>3</b> Several significant procurements actions, unfamiliar administrative requirements, procurements on critical path.	<b>2</b> Complex procurements and uncertain contracting approaches, procurements central to project success.	<b>1</b> Numerous and large acquisitions, multiple subcontractors, diverse requirements and administration.
<b>Procurement Planning</b>	List project procurement dependencies; plan a contracting approach; establish administrative methods, staff the effort, and include administrative and delivery lead-times in planning	Develop list of procurements; identify cost, schedule, type and quantity requirements; address performance issues, competition, specifications, administrative, and delivery requirements.	Develop structured approach to incorporate procurement tasks into project plans, schedules, and budgets; include procurement issues in risk management; cultivate a reliable vendor base.	Document all planned procurements, requirements, cost estimates, lead times, issues, and risks; obtain sponsor signature for plan; use peer review to verify realism and identify additional risks.
<b>Procurement Process</b>	Schedule overall procurement requirements; document procurement requests; set methods for expedited orders and deliveries; identify vendors, cost management, and approval authorities; get multiple bids.	Document contracting approaches and administrative lead-times; include order preparation in staffing, budgets, and schedules; formalize ordering, receiving and payment process.	Write administrative checklist for procurements; develop structured approach to document requirements and deliverables; pre-qualify suppliers and build vendor working relationships.	Treat procurements as projects and plan budgets, schedules, and spec. development process; establish contract types, write S.O.W.s and develop selection criteria and contract administration process.
<b>Procurement Liaison</b>	Contact procurement officials and discuss plans to support the project; solicit their requirements and issues; maintain an active communications exchange; provide written requests.	Obtain procurement point of contact for project; deliver plans, assumptions, and schedules for review; incorporate comments and recommendations into project plans.	Include procurement staff in review of plans, distribution of project communications, attendance at meetings, and in project team building activities.	Bring a dedicated contracts liaison official into the project team; solicit review and approvals for documented procurement strategies, plans and assumptions.
<b>Contract Administration</b>	Follow-up with contractors to ensure compliance with delivery, performance, and cost requirements; manage changes deliberately; document specifications and maintain files for future use.	Track and report contract awards, milestones, and deliveries; establish controls to verify specifications and manage changes; track and report status of orders, invoices, and payments.	Establish project files for all contracts, specifications, and deliverables; formalize contract modification process; use metrics to track and report status of deliverables.	Establish a project office function to track contract modifications, deliverables (receipt, review, comments, and acceptance), contract correspondence; establish a subcontract management role.

This table shows techniques for managing multiple projects, using project categorization, a scaleable methodology, baseline reporting, and exception management.

<b>Priority/ Risk</b>  <b>Project Area</b>	<b>4</b>  <b>Less than 3 large projects with less than 12 projects overall.</b>	<b>3</b>  <b>Less than 8 large projects, with less than 40 projects overall.</b>	<b>2</b>  <b>Less than 20 large projects, with less than 100 projects overall.</b>	<b>1</b>  <b>Very large, complex multi- project environment; substantial organizational reliance on project success.</b>
<b>Management Leadership</b>	Require project management principles be applied to all projects; participate in project selection, approval, milestone reviews, and replan approvals; collect and track baseline data for all projects.	Require PM disciplines be applied and maintained for all projects; oversee baseline controls and metrics tracking; maintain organization level project tracking.	Maintain PM principles and disciplines from top management down; require implementation of PM policy and practices; build PM support infrastructure and recognize functional identity.	Promote project management as enterprise core competency; demonstrate senior leadership and commitment in words and deeds; build a supporting project culture of policies, practices, and support systems.
<b>Organization and Staffing</b>	Include project management in organizational priorities; adjust organization to support project management objectives; provide budgets for project management staffing, training, and support systems.	Define explicit PM functions in organization; provide staffing to support metrics, methodologies, and tools; budget project management at 6-10% of project totals.	Identify managing sponsors for all PMs; maintain dedicated PM support functions; assign senior management contact for oversight of project methodologies, systems, and results; develop skills mentors.	Provide dedicated senior leadership in project management oversight; use <i>strong matrix</i> organization; build project control and support expertise; track progress against maturity criteria.
<b>Policies and Procedures</b>	Insist on implementation of basic project management principles - documented requirements, realistic plans, periodic reviews, baseline controls, documentation, testing and customer focus.	Document PM methodology for flexible application to all projects; establish policies for project selection, approval, definition, baseline control, milestone reviews, and metrics.	Document PM methodology explicitly for each project; prioritize approval levels, summary metrics and exception reporting; systematize risk identification, assessment and tracking.	Manage project baselines on an exception basis; classify projects and invoke scaleable management requirements; conduct baseline reporting, tracking, trend analysis, and milestone reviews.
<b>Systems and Tools</b>	Provide a software tool for integrated scheduling, and resource planning; establish project planning conventions and training; use tools for action-item tracking and team communications.	Provide software tools and systems to roll up data for multi-project summaries and resource leveling; share support tools for administration and controls; refine communications networks.	Provide automated PM tools and methodology templates; maintain repository of systems, methods, and tools; track user support requests; monitor competency levels and conduct training needs analysis.	Conduct enterprise-wide cost and resource tracking; provide compatible family of tools for cost/schedule tracking, data management, action-item tracking, communications, cost estimating libraries, etc.
